CHAPTER 1

INTRODUCTION

1.1 OVERVIEW

Diabetes is a chronic disease with the potential to cause a worldwide health care crisis. According to International Diabetes Federation 382 million people are living with diabetes across the whole world. By 2035, this will be doubled as 592 million. Diabetes mellitus or simply diabetes is a disease caused due to the increased level of blood glucose. Various traditional methods, based on physical and chemical tests, are available for diagnosing diabetes. However, early prediction of diabetes is quite challenging task for medical practitioners due to complex interdependence on various factors as diabetes affects human organs such as kidney, eye, heart, nerves, foot etc.

In this project, we need to diagnostically predict whether or not a patient has diabetes, based on certain diagnostic measurements included in the dataset. Several constraints were placed on the selection of these instances from a larger database. In particular, all patients here are females at least 21 years old of Pima Indian heritage.

The main objective of the project is to determine if the female is diabetic or not. Few parameters are used to determine if a female is diabetic or not.

The datasets consist of several medical predictor variables and one target variable, Diabetes. Predictor variables include the number of pregnancies the patient has had, their BMI, insulin level, age, and so on.

1.2 PURPOSE

The objective of this project is to build a predictive machine learning model to predict based on diagnostic measurements whether a patient has diabetes.

This is a binary classification project with supervised learning. The aim of this project is to develop a system which can perform early prediction of diabetes for a patient with a higher accuracy by combining the results of different machine learning techniques.

CHAPTER 2

LITERATURE SURVEY

2.1 EXISTING PROBLEM

Accuracy has always been the main problem for any newly developed system. When it comes to the field of health, proper results are very crucial for the doctor to take important decisions for improving the patients' health. For accurate outputs, we use the machine learning algorithms. As we know, machine learning is a process where the machine learns from its past decisions and performs tasks, without requiring explicit programming. So, it is a well suited approach for Diabetes Prediction System.

Fig 1: Trend of Diabetes proportion over the years

In the past 30 years of development in China, with rising number of diabetics, people have started to realize that this chronic disease has deeply impacted every family and everyone's daily life. There is an ascending trend in the proportion of diabetics in the general population.

- In 2017, National Diabetes Statistic Report for Center Disease Control and Prevention (CDC), gives the facts give an account of the United States that 30.3 million individuals have diabetes, among that 23.1 are analysed and 7.2 million are undiscovered individuals.

- In 2018, the American Diabetes Association models of therapeutic care in diabetes discharges a report about “Order and finding of diabetes” which incorporates the arrangement of diabetes, diabetes care, treatment objectives, criteria for conclusion test ranges and dangers esteems, chance engaged with diabetes.
- In 2017, Global provides details regarding Diabetes by world wellbeing association; it expresses the weight of diabetes, hazard components and inconveniences of diabetes. Likewise, gives the data about counteracting diabetes in individuals with high hazard and overseeing diabetes at beginning times with fundamental solutions to be taken.

The need for a system which accurately predicts the outcome is very essential as it pertains to the life of a person, and diseases like diabetes, if not detected in early stages, can prove to be very fatal.

As we all know, the number of diabetics is large, and it is continuously increasing. Additionally, most people know little about their health quality. Therefore, believe it is necessary to establish a model that can predict if the patient has traces of diabetes based on various parameters (pertaining to their health) from the first examination time for the high-risk DM group.

2.2 PROPOSED SOLUTION

In recent years, using the Machine Learning technique has been used with increasing frequency to predict the possibility of disease. Many algorithms and toolkits have been created and studied by researchers. These have highlighted the tremendous potential of this research field.

Machine Learning has been successfully applied to various fields in human society, such as weather prognosis, market analysis, engineering diagnosis, and customer relationship management. However, the application in disease prediction and medical data analysis still has room for improvement. For example, every hospital possesses a plethora of patient's basic and medical information, and it is essential to revise, supplement, and extract meaningful knowledge from these data to support clinical analysis and diagnosis. It is reasonable to believe that there are various valuable patterns and waiting for researchers to explore them.

In this project, we need to diagnostically predict whether or not a patient has diabetes, based on certain diagnostic measurements included in the dataset. Several constraints were

placed on the selection of these instances from a larger database. In particular, all patients here are females at least 21 years old of Pima Indian heritage.

The datasets consist of several medical predictor variables and one target variable, Diabetes. Predictor variables include the number of pregnancies the patient has had, their BMI, insulin level, age, and so on. The “Binary Classification” is used to predict the output, i.e. the binary numbers (0 and 1) are used as output prediction. The Outcome gives the information stating if the female is prone to diabetes or not.

CHAPTER 3

THEORITICAL ANALYSIS

3.1 BLOCK DIAGRAM

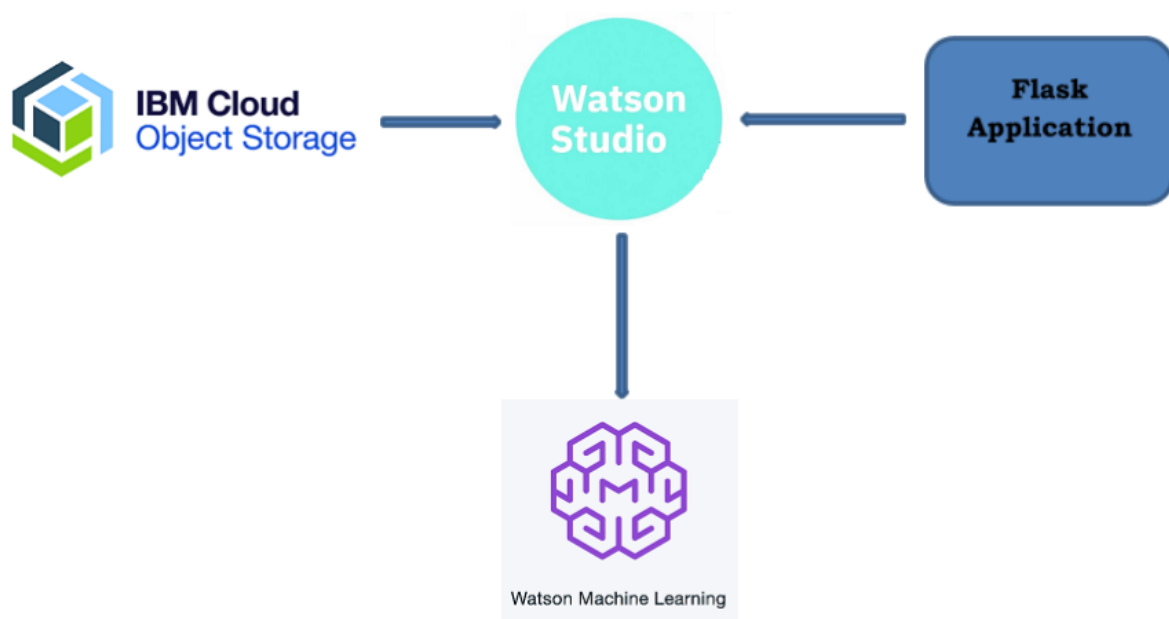

Fig 2: Block Diagram of Diabetes Prediction System

3.2 INTRODUCTION TO MACHINE LEARNING

Machine Learning (ML) is a subset of AI. Machine Learning is a latest buzzword floating around. It deserves to, as it is one of the most interesting subfield of Computer Science. Machine Learning is the most in-demand technology in today's market. Here's a list of reasons why Machine Learning is so important:

- **Increase in Data Generation:** Due to excessive production of data, we need a method that can be used to structure, analyse and draw useful insights from data. This is where Machine Learning comes in. It uses data to solve problems and find solutions to the most complex tasks faced by organizations.

- **Improve Decision Making:** By making use of various algorithms, Machine Learning can be used to make better business decisions. For example, Machine Learning is used to forecast sales, predict downfalls in the stock market, identify risks and anomalies, etc.
- **Uncover patterns & trends in data:** Finding hidden patterns and extracting key insights from data is the most essential part of Machine Learning. By building predictive models and using statistical techniques, Machine Learning allows you to dig beneath the surface and explore the data at a minute scale. Understanding data and extracting patterns manually will take days, whereas Machine Learning algorithms can perform such computations in less than a second.
- **Solve complex problems:** From detecting the genes linked to the deadly ALS disease to building self driving cars, Machine Learning can be used to solve the most complex problems.

3.3 SOFTWARE DESIGNING

We develop an end-to-end web application that predicts the probability of females having diabetes. The application must be built with Python-Flask with the machine learning model trained & deployed on IBM Watson Studio.

The software requirements are:

- IBM Watson Studio
- IBM Cloud
- Node-Red
- Visual Studio Code

The languages used are:

- Python
- HTML

3.3.1 IBM WATSON STUDIO

IBM Watson Studio helps you build and scale AI with trust and transparency by automating AI lifecycle management. It empowers you to organize data, build, run and manage AI models, and optimize decisions across any cloud using IBM Cloud Pak for Data.

With Watson Studio, we are doing the following:

- Extending the capabilities we provide around deep learning, including TensorFlow scoring
- Allowing you to access pre-trained models from the Watson Services, such as Watson Visual Recognition
- Enabling you to bring in non-structured data
- Further automating and providing insight into model management
- Continuing to provide you with a choice of best-in-breed data science/ML tools
- Enabling you to visualize the insights with dynamic dashboards

3.3.2 IBM CLOUD

The IBM cloud platform combines platform as a service (PaaS) with infrastructure as a service (IaaS) to provide an integrated experience. The platform scales and supports both small development teams and organizations, and large enterprise businesses. Globally deployed across data centres around the world, the solution you build on IBM Cloud spins up fast and performs reliably in a tested and supported environment you can trust.

Whether you need to migrate apps to the cloud, modernize your existing apps by using cloud services, ensure data resiliency against regional failure, or leverage new paradigms and deployment topologies to innovate and build your cloud-native apps, the platform's open architecture is built to accommodate your use case.

Using the IBM Cloud catalog, we can perform the following tasks:

- Create resources
- Manage our resources
- Add Cloud Foundry services and develop Cloud Foundry apps(Node-red)
- Add all necessary services.

3.3.3 NODE-RED

Node-RED is a programming tool for wiring together hardware devices, APIs and online services in new and interesting ways. It provides a browser-based editor that makes it easy to wire together flows using the wide range of nodes in the palette that can be deployed to its runtime in a single-click.

After creating the node-network (e.g.: sample.json file), import the JSON file and then deploy the file to save it. We can then easily give the input values for our project and determine the output, and also see the request-flow among the nodes, and how exactly the response is obtained.

Node-RED is based on Node.js which is JavaScript. JavaScript is the language of the web, Node.js allows you to use JavaScript as a server (back-end) language.

3.3.4 VISUAL STUDIO CODE

Visual Studio Code is a streamlined code editor with support for development operations like debugging, task running, and version control. It aims to provide just the tools a developer needs for a quick code-build-debug cycle and leaves more complex workflows to fuller featured IDEs, such as Visual Studio IDE.

We can work with different coding languages like Python, HTML; all clubbed in a single folder used in our project, and execute the programs in the VS Code terminal.

CHAPTER 4

24	7	196	90	0	0	39.8	0.451	41	1
25	9	119	80	35	0	29	0.263	29	1

Fig 3: Diabetes Data set

This initial data is collected from Kaggle. It will be used in comparative analysis of different machine learning techniques, where the best technique will be applied to predict the outcome.

Fig 4: Graph of outcome predictions

The above graph shows that the data is biased towards data points having outcome value as 0 where it means that diabetes was not present actually. The number of non-diabetics is almost twice the number of diabetic patients

4.2 CREATING AND TRAINING A DATA MODEL

- A model based on the data set is read and split into training data and test data.
- Then the training data is read and pre-processing takes place before the model is selected.
- Different types of classifier algorithms are used and as a result, pipelines are developed.

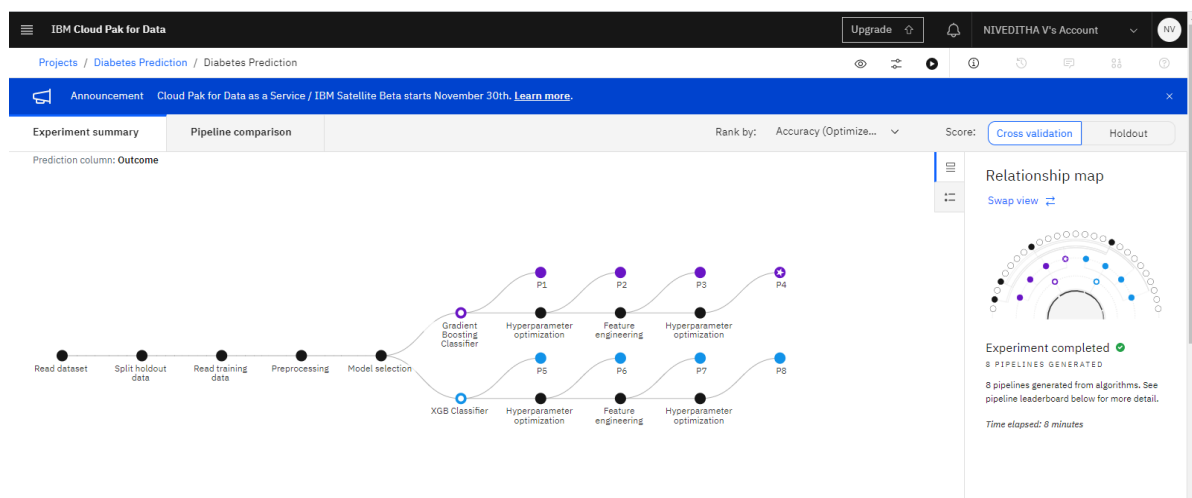

Fig 5: Progress map of the data model

90% of data from the data set is chosen as training data. 8 pipelines are generated from the Gradient Boosting Classifier and XGB Classifier as shown below:

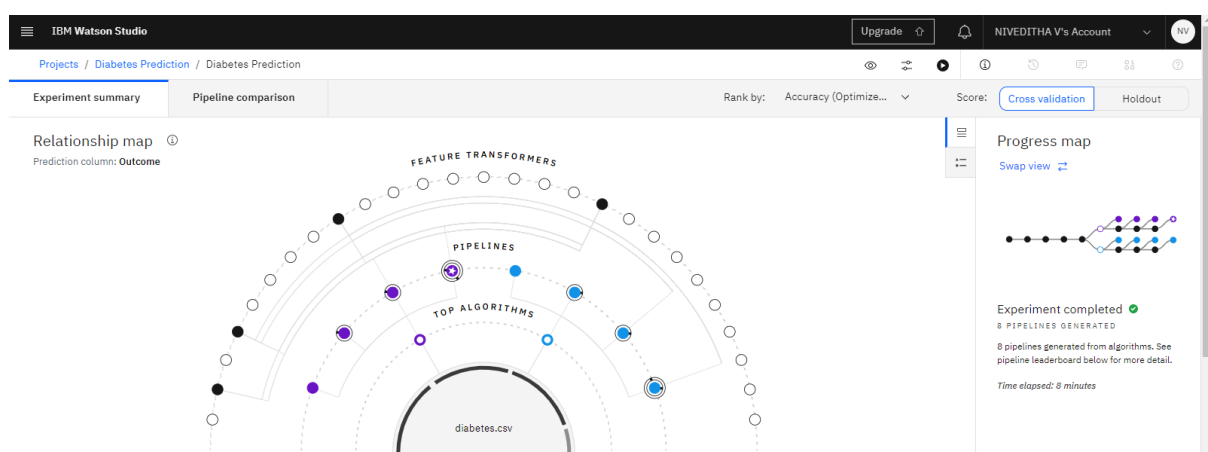

Fig 6: Generation of pipelines using different algorithms

4.3 DEPLOYING THE MODEL TO IBM CLOUD

The trained model is deployed on the IBM Cloud, to check if the predictions match the values of the dataset being used.

```

Fig 8: Test-data and its outcome

4.4 NODE CREATION USING NODE-RED

A Cloud Foundry app using node red is created for the Diabetes Prediction model. This is done with the help of Node-Red cloudant service.

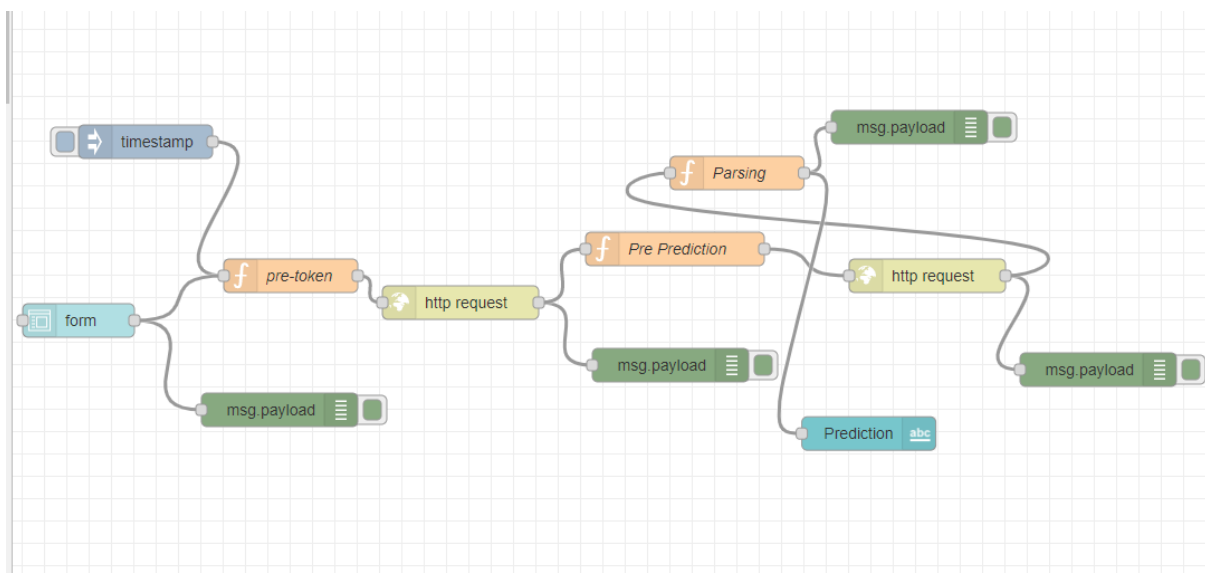

Fig 9: Creation of the nodes network

After the creation of the node network, it is deployed and tested for any errors. The token message and the prediction of the outcome is displayed in the Debug Console.

Now, the test-data values are tested by launching the output of the created nodal network as shown below:

Diabetics

CHAPTER 5

FLOWCHART

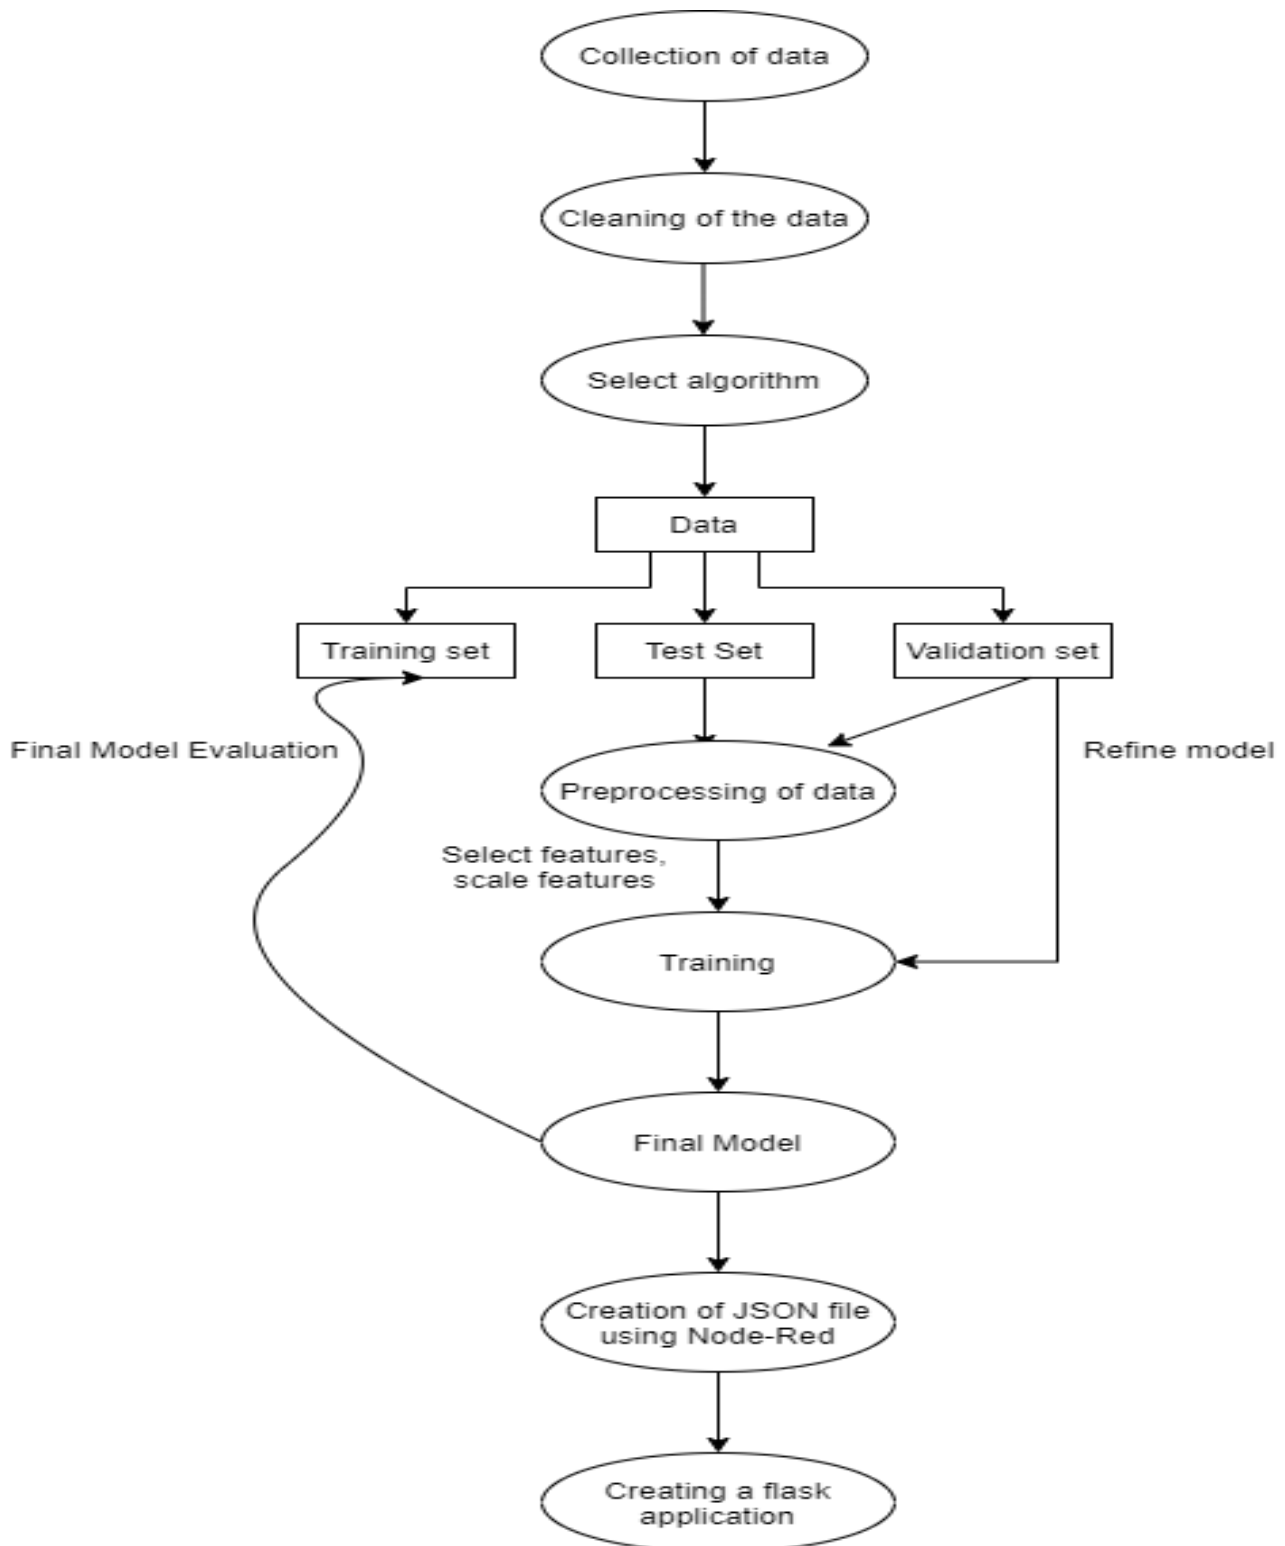

Fig 11: Flowchart

CHAPTER 6

RESULT

We open a new terminal in VS Code, and execute the python program using the command:

Python file_name.py

This is done as shown below:

```
PS C:\Users\Hp\Desktop\Diabetes Prediction> python dpapp.py
* Serving Flask app "dpapp" (lazy loading)
* Environment: production
  WARNING: This is a development server. Do not use it in a production deployment.
  Use a production WSGI server instead.
* Debug mode: on
* Restarting with stat
* Debugger is active!
* Debugger PIN: 799-753-707
* Running on http://127.0.0.1:5000/ (Press CTRL+C to quit)
```

Fig 12: Execution of the program in the terminal

Now to open the front-end(flask application, we must press Ctrl+ mouse click on the link obtained after successful compilation of the program, i.e. <http://127.0.0.1:5000/>

Now, it opens the flask application where we have to give values of various parameters and the output is displayed as Prediction (1 or 0)

- 1- Woman is diabetic
- 2- Woman has no risk of diabetes

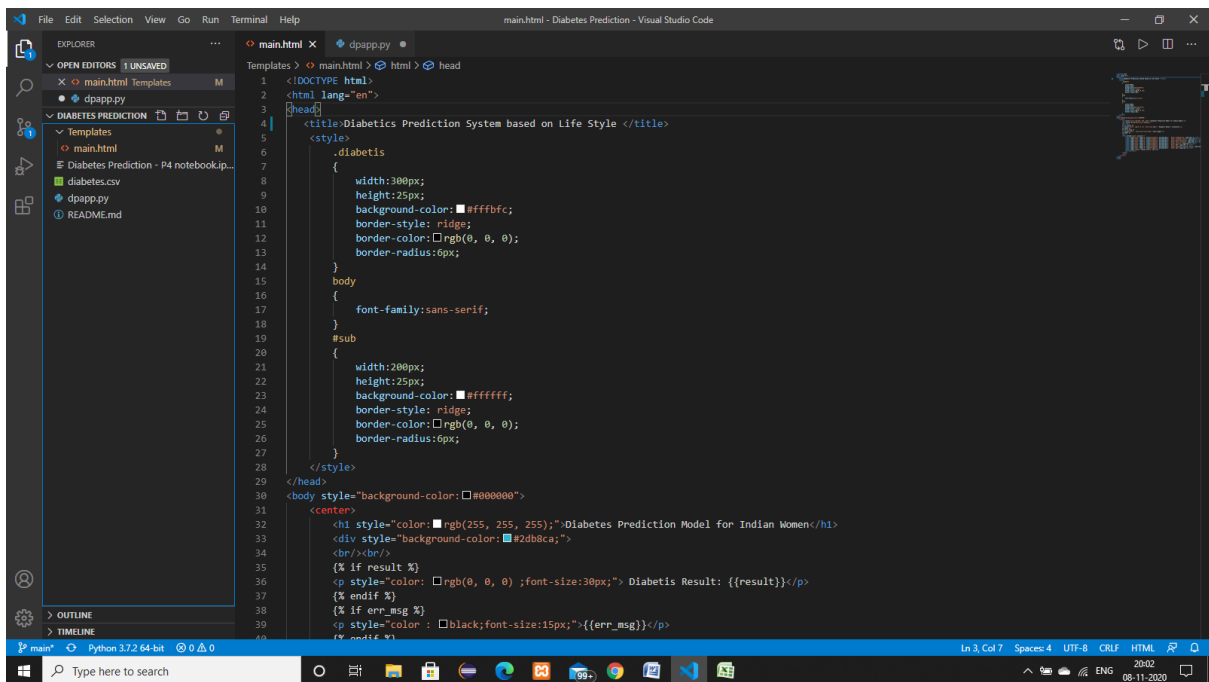

Fig 16: Node-RED Dashboard output

The screenshot shows the Visual Studio Code editor with the file explorer on the left displaying a project named 'Diabetes Prediction'. The file explorer lists 'main.html', 'diabetes.csv', 'dpapp.py', and 'README.md'. The editor window shows the code for 'dpapp.py', which is a Flask application. The code includes imports for Flask, requests, and json, and defines a route for '/'. The route handler checks for POST and GET methods and processes form data to predict diabetes. It uses an IBM Cloud IAM token for authentication and a scoring API to get the prediction result. The status bar at the bottom indicates the file is on line 24, column 27, with 4 spaces, UTF-8 encoding, and CR/LF line endings.

```
1 from flask import Flask,render_template,request,url_for
2 import requests
3 import urllib3, json
4 app=Flask(__name__)
5 @app.route('/',methods=['POST','GET'])
6 def hello():
7     if request.method=='POST':
8         preg=request.form['a']
9         glc=request.form['b']
10        bp=request.form['c']
11        skt=request.form['d']
12        ins=request.form['e']
13        bmi=request.form['f']
14        dpf=request.form['g']
15        age=request.form['h']
16        print(age,glc,bp,skt,ins,bmi,dpf,age)
17    try:
18        preg=int(preg)
19        glc=int(glc)
20        bp=int(bp)
21        skt=int(skt)
22        ins=int(ins)
23        bmi=float(bmi)
24        dpf=float(dpf)
25        age=float(age)
26    except:
27        return render_template('data.html',err_msg='Enter Valid Data')
28    url = "https://iam.cloud.ibm.com/identity/token"
29    headers = {"Content-Type": "application/x-www-form-urlencoded"}

CHAPTER 7

ADVANTAGES & DISADVANTAGES

7.1 ADVANTAGES

- Identification without visiting to Diagnostic centre.
- No need to waste money for tests.
- No waiting time and anxiety for reports.
- Can identify at early stage so that care can be taken.

7.2 DISADVANTAGES

- The disadvantage of the online prediction tool is its sensitivity and accuracy for clinical use. It completely depends on the dataset used to train the model for prediction.
- Prediction can be wrong sometimes according to confusion matrix which may create worst consequences.
- Accuracy can be less sometimes.
- Some more parameters can be needed sometimes for predicting accurately.

CHAPTER 8

APPLICATIONS

- The project serves as a prototype to a real-time system which can be created using Machine Learning algorithms.
- The developed project helps us understand how the developed model works, its behaviour and the output for different test data.
- Understanding these aspects before in hand will help us develop the real-time system much easily without much difficulty. Here, we use Binary Classifier algorithm.
- Contrastingly, we can use K-means or Decision tree approaches as well to get the same predictions output, which can later be implemented in real-time.

CHAPTER 9

CONCLUSION

- Most of the population all around the world has diabetes. Predicting this disease at earlier stages plays vital role for treatment of patient.
- The Pima Indian diabetes dataset has been used in this model.
- The algorithm is best among others and got 77% accuracy.
- The obtained results appear to be very important for predicting diabetes accurately.
- The main theme is to prevent and cure diabetes and to improve the lives of all people affected by diabetes at faster rate and to help the doctors to start the treatments early.

CHAPTER 10

FUTURE SCOPE

- The Accuracy obtained is 77%.
- It can be increased by following different methods either by considering more parameters or huge data set can be used to train the model.
- The confusion matrix clearly states that there can be false positive, false negative cases which can cause to serious consequences and to be overcome in future researches.
